PROFESSIONAL SUMMARY

Software engineer with 5+ years in C#, .NET Core, and SQL Server. I built ~35 REST APIs for a mobile loan platform, developed a real-time monitoring app solo, maintained an ERP product's payroll module. I started in web development and moved to backend to work on newer technology, and I use ChatGPT for debugging, code review, and drafting code. Open to new opportunities.

CORE SKILLS

Languages & Frameworks: C#, .NET Core, .NET Framework, ASP.NET MVC

Backend: RESTful API Design, WinForms Application Development, Bug Diagnosis & Resolution, Secure Coding Practices (RBAC, input validation)

Databases: SQL Server (primary — schema design, stored procedures); working experience with PostgreSQL & SQLite (EECI projects)

Tooling: Azure DevOps, Git, Postman, Visual Studio

Frontend (Working Knowledge): JavaScript, React.js, HTML, CSS

Practices: Agile/Scrum, Code Reviews, SDLC, Cross-functional Collaboration

PROFESSIONAL EXPERIENCE

Software Engineer | Algorithms Software

Jun 2025 – Feb 2026

Construction ERP product built on WinForms and DevExpress · 4-person backend team

- Diagnosed and resolved recurring UI and database bugs across performance-critical ERP modules used by enterprise construction clients, stabilizing legacy WinForms components that had been a repeat source of production issues.
- Wrote and fixed SQL Server queries and stored procedures to resolve data-layer issues directly affecting end users.
- Applied secure coding practices when fixing backend logic to reduce the risk of regressions and data-integrity issues.

Software Engineer | EECI

May 2023 – Mar 2024

Hardware-to-backend data systems · Real-time monitoring application

- Sole developer on a WinForms application built from scratch over 2–3 months, reading device telemetry from SQL Server and rendering it as live-updating charts for operational monitoring — owned data layer, business logic, and UI end to end.
- Used **PostgreSQL and SQLite** as the data layer on two internal projects alongside the core SQL Server work, handling schema design and query writing on each.
- Fixed bugs and maintained a separate C# / .NET service that exchanged data between hardware devices and backend systems.
- Worked with the team on validation and error-handling logic to improve the reliability of data ingestion from hardware sources.

Backend Developer | D2K Technologies

Mar 2022 – Apr 2023

Loan application platform · ~10-person team · Client-facing web and mobile APIs

- Built and maintained ~35 client-facing RESTful APIs in .NET Core for the mobile application, serving as the primary backend contributor on that surface.
- Acted as the main liaison between the database team and frontend/mobile developers, translating data requirements and resolving integration issues to keep both sides unblocked.
- Implemented RBAC and input validation on loan application endpoints to enforce authorization rules and reduce security surface area.
- Worked on SQL Server schema and stored procedures with the DB team to support new API requirements.
- Ran internal sessions on API design patterns and database usage to align team practices.

Web Developer | LearningMate Solutions *Aug 2019 – Mar 2022*

Large-scale K-12 e-learning platform · Thousands of daily active users

- Built and maintained backend features — including course content delivery and student-facing workflows — for a K-12 e-learning platform serving thousands of daily active users.
- Worked across the stack: backend API development in .NET alongside frontend integration in JavaScript, HTML, and CSS.
- Participated in structured code reviews and QA collaboration that reduced production defect rates.

NOTABLE WORK

Construction ERP — Algorithms Software

C# · WinForms · DevExpress · SQL Server · Azure DevOps

- Windows-based ERP product for construction companies. Worked on the payroll team fixing bugs and building new features.

Real-Time Device Monitoring Application — EECI (sole developer)

WinForms · C# · SQL Server · PostgreSQL/SQLite

- Took the application from blank project to production deployment in 2–3 months as the only developer on it, handling database reads, business logic, and the live-charting UI.

Loan Application Backend — Mobile API Layer — D2K Technologies

.NET Core · C# · SQL Server · REST APIs

- Primary backend developer for the mobile-facing API layer of a loan application platform, building ~35 client-facing endpoints covering intake, approval, and status tracking.
- Implemented RBAC and secure input handling across loan workflow endpoints; coordinated with DB and frontend teams to keep API contracts aligned with data availability and frontend requirements.

EDUCATION

Bachelor of Engineering – Information Technology

Mumbai University | 2015 – 2019
